

## Water Conservation

Here are some helpful tips to conserve water and maintain the health of your lawn:

- **Water deeply but infrequently** - set your irrigation system to run twice per week to deliver 3/4 inch of water per zone. For pop-up sprinklers, 20-30 minutes will deliver the proper amount of water. For rotor head sprinklers, 45-60 minutes will deliver the proper amount of water.
- **Don't set it and forget it** - adjust your watering frequency on a regular basis in conjunction with the weather patterns. During the rainy season, you may need to reduce your watering frequency.
- **Check your Water Management District's regulations** - <http://sjr.state.fl.us/>
